Task Report 01

Title: Data Cleaning and Initial Data Exploration Using a Kaggle Dataset in Google Colab

Objective

The objective of this lab is to learn the basic preprocessing steps required before building any Machine Learning model. This includes downloading a dataset from Kaggle, importing it into Google Colab, examining its structure, identifying missing values and duplicate records, and preparing a clean dataset for future Machine Learning tasks.

Tools Used

- Google Colab
- Python
- Pandas
- NumPy
- Kaggle Dataset

Dataset Information

Dataset Name: Student Math Performance Dataset

Source: Kaggle

Dataset File: student_math_clean.csv

Introduction

Data cleaning is one of the most important stages in Machine Learning. Before training any model, the dataset must be checked for missing values, duplicate records, incorrect data types, and other inconsistencies. Clean data helps improve the accuracy and reliability of Machine Learning models.

In this lab, a student performance dataset was downloaded from Kaggle and analyzed using Google Colab. Various preprocessing techniques were applied to ensure the dataset was ready for further Machine Learning tasks.

Procedure

Step 1: Download Dataset

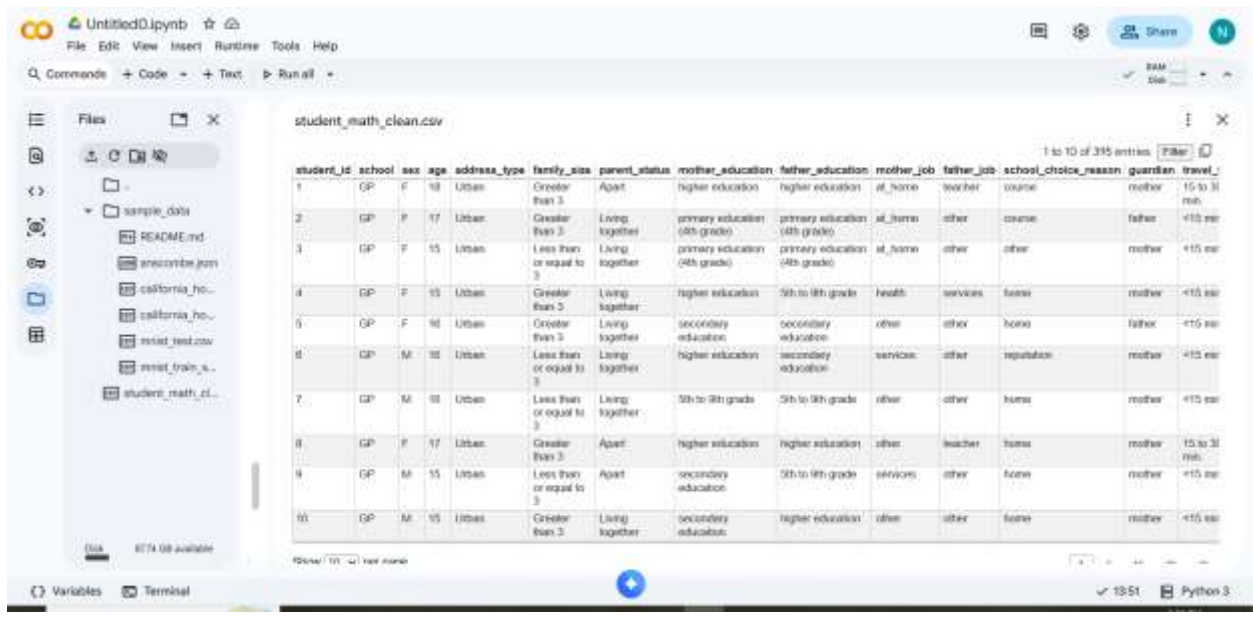

The dataset was downloaded from Kaggle in CSV format.

Step 2: Open Google Colab and Upload Dataset

A new notebook was created in Google Colab.

The downloaded CSV file was uploaded into Google Colab.

Step 3: Import Required Libraries and Load Dataset

- The required Python libraries were imported.
- import pandas as pd
- Import numpy as np
- The dataset was loaded into a Pandas DataFrame.
- df = pd.read_csv("student_math_clean.csv")
- The first five rows of the dataset were displayed.
- df.head()

Observation

The dataset loaded successfully and displayed the first five records.

Check Dataset Information

The structure of the dataset was examined.

df.info()

Observation

- Total Records: **395**
- Total Columns: **34**
- Dataset loaded successfully.
- Data types include integers and object (categorical) values.

The screenshot shows a Jupyter Notebook interface with the following code and output:

```
import pandas as pd
import numpy as np
df = pd.read_csv("student_math_clean.csv")
df.head()
df.info()
```

The output of `df.info()` is displayed as follows:

```
<class 'pandas.core.frame.DataFrame'>
Int64Index: 395 entries, 0 to 394
Data columns (total 34 columns):
 #   Column              Non-Null Count  Dtype  
---  -
 0   student_id          395 non-null   int64  
 1   school              395 non-null   object  
 2   sex                 395 non-null   object  
 3   age                 395 non-null   int64  
 4   address_type        395 non-null   object  
 5   family_size         395 non-null   object  
 6   parent_status       395 non-null   object  
 7   mother_education    395 non-null   object  
 8   father_education    395 non-null   object  
 9   mother_job          395 non-null   object  
10   father_job          395 non-null   object  
11   school_choice_reason 395 non-null   object  
12   guardian            395 non-null   object  
13   travel_time         395 non-null   object  
14   study_time          395 non-null   object  
15   class_failures      395 non-null   int64  
16   subject_completed   395 non-null   object
```

The first five rows of the dataset are displayed in a table view:

student_id	school	sex	age	address
1	GP	F	18	Urban
2	GP	F	17	Urban
3	GP	F	15	Urban
4	GP	F	15	Urban
5	GP	F	16	Urban

Step 4: Check Missing Values

The dataset was checked for missing values.

```
df.isnull().sum()
```

Observation

No missing values were found in any column.

Step5: Check Duplicate Records

The dataset was checked for duplicate rows.

```
df.duplicated().sum()
```

Observation

Output: 0

This indicates that there are no duplicate records.

Step 6: Check Dataset Dimensions

The dataset dimensions were examined.

`df.shape`

Observation

(395, 34)

Meaning:

- 395 Rows
- 34 Columns

Step 7: Generate Summary Statistics

The statistical summary of numerical columns was generated.

`df.describe()`

Observation

The summary includes:

- Count
- Mean
- Standard Deviation
- Minimum
- Maximum
- Quartiles

These statistics help understand the distribution of numerical data.

Findings

- The dataset contains **395 records** and **34 attributes**.
- No missing values were detected.
- No duplicate records were found.
- The dataset is already clean and suitable for Machine Learning applications.
- Both numerical and categorical features are present in the dataset.

Conclusion

The Kaggle student performance dataset was successfully imported into Google Colab and thoroughly examined. The dataset was inspected for missing values, duplicate records, data structure, and statistical information. Since no missing or duplicate values were found, the dataset required no additional cleaning and is ready for further Machine Learning tasks such as Linear Regression, Polynomial Regression, and predictive modelling.

Learning Outcomes

After completing this task, I learned how to:

- Download datasets from Kaggle.
- Upload datasets into Google Colab.
- Import Python libraries.
- Load datasets using Pandas.
- Display dataset contents.
- Analyze dataset structure.
- Identify missing values.
- Detect duplicate records.
- Generate descriptive statistics.
- Prepare a dataset for Machine Learning.
